Course Name : Certificate Course in Programming through C and C++

Course Code : PCC-1

**Duration of the
Course (in hours)** : 45 hrs.

Fees (INR) : NIL

**Minimum Eligibility
Criteria & pre requisites** : Basic knowledge of computer

Objective of the course:

The course is designed to provide programming fundamentals using C & C++. By the end of this course, participants will be able to:

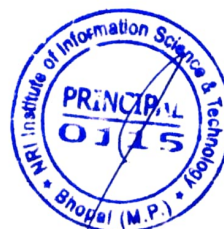

- Read and write the C and C++ code.
- Understand how to use the concept of data structure and object oriented design principles in the context of the C and C++ languages respectively.
- Able to work on file handling in both the language.
- Use the C++ interfaces and libraries.

Learning outcomes:

After the completion of the course, participant will be able to:

- Understand the basic terminology used in computer, write, compile and debug programs in C language and use different data types in a computer program.
- Understand object-oriented programming features in C++.
- Apply these features to program design and implementation.
- Understand object-oriented concepts and how they are supported in C++.
- Apply the concept of data structures in both the languages.

CSE

The course of study gives the participant the opportunity to go beyond the conventional curriculum. If the graduate has completed, the special skills required for engineering have been developed. C Programming is one of the oldest programming languages around and continues to inspire the world amid the proliferation of higher-level languages. C is a general language suitable for developing mostly state-of-the-art machine frameworks like OS kernels, databases, embedded systems and trillion-dollar graphics packages worldwide. C++ is an overall programming language developed as an extension of the language of C, 'C with the classes. Modern C++ features object-oriented, generically, and functional features in addition to the memory management facility at low level. The language has expanded greatly over time. It is almost always compiled, and a lot of vendors provide C++ compilers.

SYLLABUS OF LATHE MACHINE OPERATOR

Rotating Speed

It expresses with the number of rotations (rpm) of the chuck of a lathe. When the rotating speed is high, processing speed becomes quick, and a processing surface is finely finished. However, since a little operation mistakes may lead to the serious accident, it is better to set low rotating speed at the first stage.

Cutting Depth

The cutting depth of the tool affects to the processing speed and the roughness of surface. When the cutting depth is big, the processing speed becomes quick, but the surface temperature becomes high, and it has rough surface. Moreover, a life of byte also becomes short. If you do not know a suitable cutting depth, it is better to set to small value.

Sending Speed (Feed)

The sending speed of the tool also affects to the processing speed and the roughness of surface. When the sending speed is high, the processing speed becomes quick. When the sending speed is low, the surface is finished beautiful. There are 'manual sending' which turns and operates a handle, and 'automatic sending' which advances a byte automatically. A beginner must use the manual sending. Because serious accidents may be caused, such as touching the rotating chuck around the byte in automatic sending,.

Three Important Elements

A beginner of a lathe must operate with low rotating sopeed, small cutting depth and low sending speed.

Cutting Tools for Lathe

There are vrious kinds of the cutting tools for a lathe. We must choose them by the materials and shape of a part. Three typical cutting tools are introduced in follows. Then we consider what is an easy process or a hard process.

Form of Typical Cutting Tools

the most well-used cutting tool called a side tool. It can process to cut an outside surface and an edge surface. Since the material is set at the right of lathe, then this tool can only cut the right of the material.) is used at parting and grooving processes. Its pointed end is slim, then it is too weak. Don't add a strong side-force to the tool. This tool must send vertical direction only.

. It is used to cut at an inside surface. It can make a big hole, which cannot be process by a drill, and an high accurate hole.

Easy Processing and Hard Processing

The general cutting tool, shown in Figure 5(a) is the most easy hanging. Then the shape, which can be make using only the general cutting tool, has easy processing.

In the case of the parting or prooving, The process becomes hard with decreasing of the width of a alot, and increasing of the depth.

In the case of using of the boring bar, the process of a penetrated hole is not so hard. But the process of no-penetrated hole is somewhat hard. Because we cannot see the bottom surface in during process. In such cases, we decide the location of the tool with the sound or the scale of lathe. Moreover, the process of a small hole (less than 10 mm) or a depth hole is too hard.

Of course, there are impossible shapes as shown in Figure 6(c). In such case, the part must be divided or have any contrivances.

Easy Processing and Hard Processing

Hearing the Sound

In the case of the lathe process, sharpness is known from scraps of the material or a processing surface. In addition, it is also important to hear the sound. For example, when the sound is too high, the

processing is not suitable. It is caused by the bad edge of the tool, too higher rotating speed of the lathe, or vibrating of a thin material.

Setting of a Cutting Tool

In case a cutting tool is fixed to a table, thin metal plates are put between the tool and the table, and the height of the edge is adjusted to the center of material.

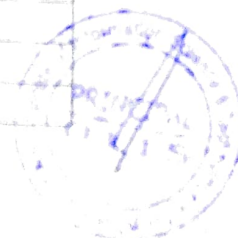

In the case of using the general cutting tool, when the edge is higher than the center of material, the edge of a blade does not hit the material, and it cannot cut at all. Conversely, if the edge is low, it becomes impossible to cut the center of material. Moreover, the scale of a handle does not have correct value, then accurate processing becomes impossible.

The course of study gives the participant the opportunity to go beyond the conventional curriculum. If the graduate has completed, the special skills required for engineering have been developed. Previously, web design was mostly focused on creating websites for desktop browsers; but, since the mid-2010s, mobile and tablet browser design has become increasingly essential.

A web designer is responsible for a website's appearance, layout, and, in certain situations, content. For example, appearance refers to the colours, typography, and images utilised. The way information is organised and grouped is referred to as layout. A good web design is simple to use, aesthetically pleasant, and appropriate for the website's target audience and brand. Many webpages are created with a focus on simplicity, with no unnecessary content or functionality that could confuse or distract users.
